                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to novel nucleic acid molecules encoding NOVX CC polypeptides selected from NOV1 to NOV11 inclusive, as well as variants CC thereof. Specifically, it refers to vectors, host cells, antibodies, CC agonists, antagonists and recombinant methods for producing proteins and composits, antagonists and recombinant methods for producing proteins according GPCRs, secretory proteins and dual specificity phosphatases. CC including GPCRs, secretory proteins and dual specificity phosphatases. CC including Crohn's disease that can be used to treat neurodegenerative cincluding Crohn's disease and rheumatoid arthritis, as well as compositions that can be used to treat neurodegenerative conditions including crohn's disease and rheumatoid arthritis, as well as conditions including osteoporosis, angina pectoris, hypotension, anxiety, CC conditions including osteoporosis, angina pectoris, hypotension, anxiety, CC anlipsecia, bulimia, cancer and manic depression. As such, they exhibit various activities including vulnerary, virucide, antibacterial, CC dermatological, osteopathic, antiarthritic, antiinflammatory, cytostatic, CC dermatological, osteopathic, antiarthritic, antiinflammatory, cytostatic, CC antianginal, immunosuppressive and antidepressant. This oligonucleotide is a PCR primer used to amplify human NOVX DNA in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The invention may be useful for the development of compounds with an antidiabetic or anorectic activity. The method is useful for diagnosing a predisposition to fat deposition, leanness or NIDDM. The nucleic acid encoding the polypeptide is useful for diagnosing conditions or diseases including fat deposition or NIDDM, also in treating diabetes and obesity. The present sequence is that of a PCR primer which was used for amplification of a region of the human purinergic receptor (P2X4) gene sequence in the examilification of the invention
This invention relates to a novel method of diagnosing a predisposition to fat deposition, leanness or non-insulin dependent diabetes mellitus (NIDDM) in a subject. The method comprises detecting the presence or absence of a polymorphic variation associated with fat deposition, nucleotide sequence in a nucleic acid sample from a subject. The invention may be useful for the development of compounds with an antidiabetic or anorectic activity. The method is useful for diagnosing a predisposition to fat deposition, leanness or NIDDM. The nucleic acid encoding the polypeptide is useful for diagnosing conditions or diseases including fat deposition or NIDDM, also in treating diabetes and obesity. The present sequence is that of a PCR primer which was used for amplification or a region of the human purinargic receptor (P2X4) gene sequence in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 7 A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosing predisposition to fat deposition, leanness or non-insulin dependent diabetes mellitus (NIDDM) comprises detecting the presence absence of a polymorphic variation in a purinergic receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-DEC-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                         The invention relates to a novel diagnostic polynucleotide composition.

The polynucleotide composition comprises: a sequence encoding a polypeptide with defined sequences given in the specification; a sequence capable of hybridizing to a melanin-concentrating hormone receptor 1

(MCHRI) gene, a polynucleotide encoding an MCHRI polypeptide; or a sequence comprising one or more of the nucleotide exchanges (SNP's) given in the specification and at least 8 bases of surrounding sequence of the CMCHRI gene. The composition has anorectic activity. The polynucleotide composition may be used in gene therapy to treat the disorders of the invention. The composition is useful for diagnosing obesity related to the presence of a molecular variant of the MCHRI gene or a susceptibility to the disorder. The MCHRI protein or polynucleotide is useful for preparing a medicament for treating or preventing obesity related to the presence of a molecular variant of the MCHRI gene. This polynucleotide is useful for presence of a molecular variant of the MCHRI gene. This polynucleotide

                                                                                                                                                                                                                                                                             capable of hybridizing to a melanin-concentrating hormone receptor 1 (MCHR1) gene; a polynucleotide encoding an MCHR1 polypeptide; or a sequence comprising one or more of the nucleotide exchanges (SNP's) given in the specification and at least 8 bases of surrounding sequence of the MCHR1 gene. The composition has anorectic activity. The polynucleotide composition may be used in gene therapy to treat the disorders of the invention. The composition is useful for diagnosing obesity related to the presence of a molecular variant of the MCHR1 gene or a susceptibility to the disorder. The MCHR1 protein or polynucleotide is useful for preparing a medicament for treating or preventing obesity related to the presence of a molecular variant of the MCHR1 gene. This polynucleotide represents an MCHR1 primer of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel diagnostic polynucleotide composition. The polynucleotide composition comprises: a sequence encoding a polypeptide with defined sequences given in the specification; a sequence capable of hybridizing to a melanin-concentrating hormone receptor 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New diagnostic composition, useful presence of a molecular variant of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Unidentified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             obesity; primer;

                                                                                                                                                                                 The invention relates to a novel method for detecting a gene polymorphism in a human interleukin (II)-18 gene. The method involves detecting a 9 base insertion between -6311 position and -6310 position, a polymorphism at positions -5890, -5316, -4762, -4675, -3268, -689 and -640 of a polymucleotide which consists of a fully defined sequence of 6640 base pairs as given in the specification, where in the 6640bp polymucleotide, the position 6575 is set to +1 from which numbering is performed. The method is useful for detecting gene polymorphism in II-18 gene of human and for detecting adult onset still disease. This polymucleotide sequence represents a probe of the human interleukin-18 gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens.

                                                        The invention relates to novel human NOVX nucleic acids and polypeptides. The polypeptide, nucleic acid or antibody is useful for preparing a composition for treating or preventing a NOVX-associated disorder, e.g., neurodegenerative or autoimmune disorders or cancer. The present sequence represents a PCR primer used to isolate human NOVX genes of the
                                                                                                                                         New NOVX polypeptide, useful for preparing a preventing a NOVX-associated disorder, e.g., autoimmune disorders or cancer.
                                                                                                                                                                                                                                                          Padigaru M,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        25-NOV-2002; 2002US-0429136P.

The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of a Extend primer of the invention which was used to genotype single

The present invention relates to a method for identifying a subject at CC risk of breast cancer. The method comprising detecting the presence or cc absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The nucleic acid sample (comprises the DLG1 region (AD079402), KIAA0783 region (AD079403), DPF3 (cromprises the DLG1 region (AD079402)). The gene DLG1 (discs, region (AD079404) or CENPC1 region (AD079405). The gene DLG1 (discs, pr. hdlg or SAP97. DLG1 has been mapped to chromosomal position 3q29. The gene KIAA0783 is also known as synapse-associated protein (cromprises as transcription factor. The gene protein 14. KIAA0783 and protein is a convel gene with unknown function, however, being a zinc finger protein, crit likely to be a transcription factor. The gene DPF3 (D4, zinc and couble PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 and 2810403B03Rik. DPF3 is a Rho family guanine-nucleotide exchange factor. DPF3 has been mapped to chromosomal position 14q24.3-q31.1. The CENPC1 has been mapped to chromosomal position 4q12-q13.3. CENPC1 is a centromere autoantigen and a component of the inner chinecochore size and a timely transition to anaphase. The method is useful for identifying a subject at risk of breast cancer, to analyze and component sequence was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the DLG1, KIAA0783, DPF3 or CENPC1 regions which are associated with breast cancer in a nucleic acid sample from a
Sequence 19 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               25-NOV-2002; 2002US-0429136P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC heterologous gene, especially a gene encoding a cytotoxin, for therapy of crancer, especially neoplasias. The telomerase is necessary for the CC unrestricted proliferative capacity of many human cancers. Mutation or CC dysregulation of the telomerase repression pathway may cause reactivation CC or upregulation of the telomerase expression in cancer. Substances, CC identified in the methods, can be used to block transcription from the TR CC gene promoter through interaction of the 5' regulatory sequences. These CC gene promoter therapy. In particular, gene therapy vectors CC useful for cancer therapy. In particular, gene therapy vectors CC (especially pGT62-codAupp) comprising the promoter and a viral thymidine CC (inase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of CC telomerase RNA gene through manipulation of transcription factors may be ceffective anticancer therapy and the cloning of the hTR gene promoter CC allows the analysis of therapeutic molecules which modulate hTR promoter CC telomerase therapy and the cloning of the hTR gene promoter CC activity. Sequences AAZO7623-80 represents PCR primers for amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The present invention describe novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                            hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                           AAZ37473-Z37738 represent human mdm2 phosphorothioate oligonucleotides.
AAZ37471, AAZ37472, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human mdm2 gene; proliferation; tumour; phosphorothicate; p53; cancer; antisense; modulation; oligonuclectide; expression; inhibition; hyperproliferation; blood cancer; brain cancer; breast cancer; antisers cancer; section; brosses; atherosclerosis; lung cancer; soft tissue cancer; psoriasis; fibrosis; atherosclerosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                  This is an exemplary oligonucleotide primer, for use in the detection of neoplasmic related gene mutations. There are over 40 known proto-
oncogenes and suppressor genes to date, which control growth,
development, and cell differentiation. Regulation of these genes can,
under certain circumstances, be altered and normal cells can assume
neoplastic growth characteristics. The invention provides a method for
detecting a neoplastic disorder of the head and neck or lung in a
subject. The detection of a target mutant nucleotide sequence in the
saliva is indicative of a neoplastic disorder of the head, neck or lung.
This allows early detection and therefore treatment of the preneoplasia
or cancer, and can also be used to monitor high risk patients undergoing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       neoplasia; mutant; target nucleotide; hybridization; lung cancer; ss; neck cancer; head cancer; saliva test; chemotherapy; early detection; primer; PCR; amplification.

                                                                                                                                                                                                                                                                                                                                                                     nucleobases in length that have been designed to target a 5'untranslated region, start codon, coding region or 3'untranslated region of the human receptor activator of NF kappaB (RANK). The antisense compounds specifically hybridise with and inhibit the expression of RANK. The antisense oligonucleotides are useful for inhibiting the expression of human RANK in human cells or tissues. They can be utilised for diagnostics, therapeutics for the treatment of diseases associated with the expression of RANK, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, and as research reagent. The antisense compounds are safely and effectively administered to humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human RANK antisense oligonucleotide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAF31821 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro. The hyperproliferative disorder includes cancer or psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antisense compound 8-30 nucleobases in length targeted to a nucleoacid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.

```

0,

The present invention relates to an antisense of in length targeted to nucleobases 1-308 of the 1776-1806 of the translation termination codon

compound 8-30 nucleobases e 5' untranslated region, n region or 1818-2370 of the

lated region, 1818-2370 of the

Example

9; Col

31; 77pp;

English.

                                                                                                                                                                                                                                                                                                                        Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro.
                                                                                                                                                                                                           The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon recording human mdm-2.370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human mdm2
                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                    Miraglia LJ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense; mdm2; hyperproliferation; cancer; psoriasis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                02-MAY-2001

                                                                                                                                                                                                   agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                        SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP

These can be used in the manufacture of a medicament for treating a syndrome associated with a human disease selected from a POLYX-associated disorder, where the therapeutic is a POLYX polypeptide, a POLYX nucleotide or a POLYX antibody. They may also be used to screen for a modulator of activity, or latency, or predisposition to a POLYX-associated disorder account of activity, or latency, or predisposition to a POLYX-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAS01235 standard; cDNA; 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Reverse PCR primer, used in

The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo

(I) is useful for treating a human having a disease or condition associated with (II) such as premature aging or a hyperproliferative disorder especially cancer, by inhibiting the expression of (II) in human cells or tissues. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. The products of the invention have cyrostatic activity. This sequence represents an antisense oligonucleotide used to illustrate the method of

                                                                                                                                                                                                                                                                                                                                                                  吊
                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             length targeted to the 5' untranslated region, coding region or translation termination codon region, 3' untranslated region, coding region or translation start site of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound may be antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful collections and physiological processes and useful in both clinical research and chiagnostic tools. AAS29242-AAS2907 represent the human mdm2 antisense

                                                                                                                                                     문
                                                                                                                                                                                                                                                                                                                                   The present invention relates to antisense compounds, 8-30 nucleobases in clength targeted to the 5' untranslated region, translation termination codon region, 3' untranslated region, coding region or translation start site of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for detecting the role of mdm2 expression in various cell functions and physiological processes and useful in both clinical research and

                                                                                                                                                                 for modulating the expression of human or mouse casein kinase 2-alpha prime. The antisense oligonucleotides are useful for inhibiting the expression of casein kinase 2-alpha prime, and for treating diseases or conditions associated with aberrant expression of casein kinase 2-alpha prime. Such diseases include diabetes mellitus, and hyperproliferative disorders (particularly cancers e.g. breader, prostate cancer, or liver cancer). The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. ABS67940-ABS67917 represent human or mouse casein kinase 2-alpha prime antisense oligonucleotides which comprise a phosphorothioate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an antisense oligonucleotide compound of 8 to 50 nucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibits the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 in cells or tissues. The oligonucleotides can be administered therapeutically or prophylactically to treat an animal having a disease or condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a haematopoietic disorder, a bone metabolism or cholesterol disorder, various types of cancer, neurological conditions such as Alzheimer's disease and other deregulated apoptotic pathological conditions. This polynucleotide sequence represents a human caspase 6 PCR primer relating to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (ISIS-) ISIS PHARM INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC targeted to a nucleic acid molecule encoding a BH3 interacting domain CC death agonist, where the compound specifically hybridises with and CC inhibits the expression of the BH3 interacting domain decompound of the invention is useful for inhibiting the expression of the BH3 interacting domain death agonist. The CC compound of the invention is useful for inhibiting the expression of the CC also useful for treating an animal having a disease or condition of associated with the BH3 interacting domain death agonist, e.g. CC haematopoietic disorder, hyperproliferative disorder, a developmental CC disorder, immunological disorder, or a disease or condition of the liver CC e.g., hepatitis, or a condition associated with apoptosis. The compound is useful for dispostics, therapeutics, prophylaxis and as research CC reagents and kits. This polymucleotide sequence represents an antisense C1 digonucleotide inhibitor of the DNA from human BH3 interacting domain CC death agonist RNA of the invention. NOTE: This sequence is a chimeric CC oligonucleotide 20 nucleotides in length, which is flanked on both sides by five-nucleotides. The internucleoside (backbone) linkages are CC phosphorothioate (P=5) throughout the oligonucleotide. (Updated on 29-AUG CC -2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The invention relates to a compound 8 to 50 nucleotides in length CC targeted to a nucleic acid molecule encoding a BH3 interacting domain CC death agonist, where the compound specifically hybridises with and CC inhibits the expression of the BH3 interacting domain death agonist. The CC engound of the invention is useful for inhibiting the expression of the CC also useful for treating an animal having a disease or condition CC also useful for treating an animal having a disease or condition CC associated with the BH3 interacting domain death agonist, e.g. CC disorder, immunological disorder, or a disease or condition of the liver CC e.g., hepatitis, or a condition associated with appropriate The compound is useful for diagnostics, therapeutics, prophylaxis and as research CC e.g., hepatitis, or a condition associated with appropriate The compound CC is useful for diagnostics, therapeutics, prophylaxis and as research CC e.g., hepatitis, or a condition associated with appropriate The compound CC is useful for diagnostics, therapeutics, prophylaxis and as research CC oligonucleotide inhibitor of the DNA from human BH3 interacting domain CC death agonist RNA of the invention. NOTE: This sequence is a chimeric CC oligonucleotide of the invention. NOTE: This sequence is a chimeric CC oligonucleotide of the invention is lanked on both sides by five-nucleotides. The wings are composed of 2'-methoxyethyl (2' -MOE) nucleotides. The internucleoside (backbone) linkages are phosphorothicate (P=S) throughout the oligonucleotide. (Updated on 29-AUG cc 2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 3; Page 86; 171pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel antisense compounds which inhibit the expression of phospholipase A2 (PLA2), group VI (Ca2+-independent). The invention is useful for inhibiting the expression of PLA2, group VI (Ca2+-independent) in human cells or tissues and for treating an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of human PLA2, group VI (Ca2+-independent). It is useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, tumour formation or inflammation. The present DNA sequence is an antisense oligonucleotide targetted to human PLA2, group VI (Ca2+-independent) DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antisense compounds useful for inhibiting gene expression of human phospholipase A2, group VI and for treating diseases associated with expression of phospholipase A2, group VI.

The invention describes a compound, 8-50 nucleobases in length targeted contranscriptase), where the compound specifically hybridises with and contranscriptase), where the compound specifically hybridises with and contranscriptase), where the compound specifically hybridises with and contranscriptase of contranscriptase with and contranscriptase of contranscriptase were 20 nucleotides in length and composed of a central gap region consisting of the n 2'-deoxynucleotides, flanked on both sides (5' and 3' directions) by contranscriptase (RT)-polymerase chain reactions) by nucleotides. The wings were analysed for their effect on human contranscriptase (RT)-polymerase chain reaction (PCR). The compound is useful for inhibiting the expression of TERT in cells or tissues, for treating a human having disease or condition consociated with TERT, for modulating apoptosis, for inhibiting cell correction (prostics and therapeutics. This sequence is an antisense condition coligonucleotide used to modulate the activity of nucleic acid molecules encoding TERT, described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC The invention relates to a compound that is 8 - 50 nucleobases in length CC targeted to a nucleic acid molecule encoding Casein kinase 2-beta, and CC which specifically hybridises with and inhibits the expression of Casein CC which specifically hybridises with an 8-nucleobase CC portion of an active site on a nucleic acid molecule encoding Casein CC kinase 2-beta, and a carrier or diluent; (2) inhibiting the expression of Casein kinase 2-beta in cells or tissues by contacting the cells or tissues with the compound so that the expression of Casein kinase 2-beta in cells or tissues by contacting the cells or tissues with the compound so that the expression of Casein kinase 2-beta is inhibited; and (3) treating an animal having a disease or condition associated with casein kinase 2-beta by administering to the animal the cnew compounds of the expression of Casein kinase 2-beta is inhibited. The antisense compounds are useful for modulating the expression of Casein kinase 2-beta and for treating diseases or conditions associated with expression of Casein kinase 2-beta, e.g. diabetes or typerproliferative disorders, particularly cancer, such as breast cancer, configuration, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and configuration transition between functions of various members of a biological pathway. The present sequence is an antisense oligonucleotide of the invention targeting human casein kinase 3-beta.
                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                          The invention relates to a compound of 8-50 nucleobases in length, CC targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of the compound specifically hybridises with and inhibits the expression of thuman superoxide dismutase 1 by hybridising with at least an 8-cc nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be compounds of the invention may be compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate coligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a decay gap. CC compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition arising compounds of the invention are useful for inhibiting the expression of the invention associated with this enzyme (antisense therapy), cespecially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapputics and as a research reagent, e.g. compounds of the prevent or delay infection, inflammation or tumour condition. Sequences given in records ACC40880-ACC40957 represent human condition and antisense inhibitor oligonucleotides
                                                                     Matches

                                                                                                                                                                         for modulating the expression for activating transcription factor 3 (ATF3). ATF3 is also known as liver regeneration factor-1 (LRF-1), CRG-5, LRG-21, and TI-241. The invention is useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of ATF3, such as ischaemia and diabetes. The antisense compound is useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human ATF3 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotide compounds, useful for preventing and/or treating conditions with aberrant activating transcription factor 3, such as ischemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                22-SEP-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAL61497;

                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an Artemis nucleic acid coding for a protein involved in V(D)J recombination and/or DNA repair. Sequences of the invention are useful for treating severe combined immunodeficiencies (SCID) or cancer. They are also useful for diagnosing a patient, including a prenatal diagnosis with SCID, a predisposition to cancer, a immune deficiency or a carriage of a mutation increasing the risk of progeny to have such a disease. Peptides of the invention are used for preparing antibodies. The invention is useful in gene therapy. The present sequence is a PCR primer used to amplify human Artemis exon 6 [
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New ARTEMIS nucleic acid coding for a protein involved in V(D) \mbox{\it J} recombination and/or DNA repair, useful for treating and diagnosing severe combined immunodeficiencies (SCID) or cancer.

                                                                                                                                                                                                                                               The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding BCL2-associated X (BAX) protein, where the compound specifically hybridises with the nucleic acid molecule encoding BAX protein and inhibits the expression of BAX protein. The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. Also described: (1) a composition comprising (I) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of BAX protein in cells or tissues comprising contacting the expression of BAX protein (I); and (3) treating an animal having a disease or condition associated with BAX protein is inhibited. (I) has nootropic, neuroprotective, antiparkinsonian, anticonvulsant, ophthalmological, antidiabetic and virucide activities, and can be used in antisense therapy, and as a BAX antagonist. The antisense compounds (I) are useful for modulating the expression of BAX protein, e.g. familial amylotrophic lateral selections, Alzheimer's disease, Parkinson's disease, Hodgkin's disease,

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding human inhibitor-kappa B-R (also known as I-kappaBR, IKBR, I-kappa-B-related, ikappab r, nuclear factor of kappa light polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving increased cytokine expression, or a result of infection (e.g. bacterial, viral or parasitic). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. They are also useful in antisense therapy. The present sequence is an oligonucleotide targetted to human inhibitor-kappa B-R DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; inhibitor-kappa B-R; I-kappaBR; IKBR; I-kappa-B-related; ikappab r; antisense; immune response; infection; inflammation; tumour; prophylaxis; phosphorothicate; ss.
                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides targeted to nucleic acids encoding inhibitor-kappa B-R, useful for diagnosing or treating diseases associated with expression of inhibitor-kappa B-R, e.g., a heighte immune response or infection.

The antisense oligonuclectides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonuclectides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonuclectides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonuclectide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human mdm2 antisense oligonucleotide #247.
                                                                                                                                                                                                                                                                                                                                                                                                                          Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2, useful for treating e.g. cancer, psoriasis or restenosis by inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antisense oligonucleotide; human; mdm2; hyperprolife hyperproliferative disorder; cancer; psoriasis; fibratherosclerosis; restenosis; apoptosis modulation; p2'-methoxyethoxy-residue; phosphorothicate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADD21684 standard;

The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antisense oligonucleotide; human; mdm2; hyperprolife hyperproliferative disorder; cancer; psoriasis; fib atherosclerosis; restenosis; apoptosis modulation; il 2'-methoxyethoxy-residue; phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2, useful for treating e.g. cancer, psoriasis or restenosis by inhibiting

The antisense oligonuclectides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonuclectides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonuclectides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonuclectide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mu useful for treating e.g. cancer, psoriasis or restenosis by inhibit:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Miraglia LJ,

The invention relates to a method of judging the onset risk of diabetes CC comprising detecting a haplotype consisting of gene polymorphism at 1 or CC more positions selected from (a)-(h) from a specimen containing human CC genomic DNA supplied by a patient: (a) the nucleotide located at position CC 36 of the intron 1 on GFAT1 (glutamine:fructose-6-phosphate amide CC transferase 1) gene (nucleotide number 62 in sequence ADD71329; (b) the CC nucleotide number 266 in sequence ADD71330; (c) the nucleotide located at position -147 of the intron 12 on GFAT1 gene (nucleotide number 338 in CC sequence ADD71331; (d) the nucleotide located at position 8 on GFAT1 gene (nucleotide located at position 8 on GFAT1 gene (nucleotide numbers 336-360 in sequence CC 12 on GFAT1 gene (nucleotide located at positions 1853-1877 of CC 12 on GFAT1 gene (nucleotide located at positions 1989-2007 of the intron CC 12 on GFAT1 gene (nucleotide numbers 328-347 in sequence ADD71333; (f) CC 12 on GFAT1 gene (nucleotide located at position 11 to -22 of the intron 18 on GFAT1 gene (nucleotide numbers 327-266 in sequence ADD71335; and (h) the nucleotide located at position 2632-2661 of the intron 3 on GFAT1 gene (nucleotide sequence ADD71335). The method is useful for judging relative onset risk of diabetes accompanying. This sequence represents a PCR primer used to amplify intron 8 of the GFAT1 gene in order to determine polymorphisms in the sequence of the GFAT1 gene in order to determine polymorphisms in the sequence of the GFAT1 gene in order to determine polymorphisms in the sequence of the GFAT1 gene in order to determine polymorphisms in the sequence of the seq

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the contribution codon, coding region, 5' or 3' end genomic flanking regions, coding and 3' intron-exon junctions, or regions within 2-10 nucleotides of coding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or coding an introduction and a second active agent comprising an coding an introduction and a second active agent comprising an coding antiinflammatory steroid and ubiquinone. A composition of the invention code in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also contiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, coding surfactant in a subject, stissue, or treating bronchoconstriction, and subject, stissue, or treating bronchoconstriction, coding surfactant in a subject, stissue, or treating bronchoconstriction, coding surfactant in a subject, stissue, or treating bronchoconstriction, coding surfactant in a subject, stissue, or treating bronchoconstriction, coding surfactant in a subject, stissue, or treating bronchoconstriction, coding surfactant in a subject, stissue, or treating bronchoconstriction, coding surfactant in a subject, stissue, or treating bronchoconstriction, coding surfactant in a subject stissue, or treating bronchoconstriction, coding surfactant in a subject stissue, or treating bronchoconstriction, coding surfactant in a subject stissue, or treating bronchoconstriction, coding surfactant in a subject stissue, or treating bronchoconstriction, coding surfactant in a subject stissue, or treating bronchoconstriction, coding surfactant in a subject stissue, or treating bronchoconstriction, coding surfactant in a subject stis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

cc nasal airway dysfunction and a second active agent comprising an cc antiinflammatory steroid and ubiquinone. A composition of the invention cc antiinflammatory steroid and ubiquinone. A composition of the invention common the invention common the invention cc immunosuppressive, and cytostatic activity. The composition may have a cc immunosuppressive, and cytostatic activity. The composition may have a cc preventing a respiratory, lung or malignant disease or condition, also cc for enhancing the prophylactic or therapeutic respiratory effect of an cc antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine cr creeptor, producing bronchodilation, increasing levels of ubiquinone or compute the sequence data for this patent is not represented in the printed confiction, the sequence data for this patent is not represented in the printed confiction, the print of the print The invention relates to a novel pharmaceutical composition, first active agent comprising an oligonucleotide antisense t initiation codon, coding region, 5' or 3' end genomic flanki junctions of genes encoding a polypeptide associated with lung and/or ftp.wipo.int/pub/published\_pct\_sequences intron-exon junctions, or regions within 2-10 nucleotides or 3' end genomic flanking which has the regions,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC masal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. CC lung inflammation, lung allergies, or a respiratory disease or condition. CC specification, but was obtained in electronic format directly from WIPO or a ferromated in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 1094
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of beinginone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its responding RNAs, and glucocorticoid or non-glucocorticoid steroid or corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    initiation codon, coding region, 5' or 3' end genomic flanking regions' and 3' intron-exon junctions, or regions within 2-10 nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; SEQ ID NO 7973; 872pp; English

treating SCID

New isolated nucleic acid molecule of the Artemis gene, useful

De Villartay J,

Moshous D,

Fischer A;

PCR primers ABV72389-ABV72416 were used to amplify exons of the human Artemis gene. This gene encodes a V(D)J recombination and/or DNA repair factor that belongs to the metallo beta-lactamase superfamily, and whose mutations give rise to the human RS-SCID condition. The gene is localised to chromosome 10. The Artemis gene or its nucleic acid is useful for diagnosing or treating severe combined immunodeficiencies (SCIDs) or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc recognises the delta opioid receptor variant, a vector comprising the nucleic acid, a host cell transformed to contain the vector, producing the polypeptide by culturing the host cell, identifying an agent which combinates the expression of the nucleic acid, diagnosing a genetic predisposition to an eating or energy homeostrasis disorder by detecting cc the presence or absence of the variant nucleic acid in a patient sample, cc an allele specific primer that detects a polymorphism in the gene cc encoding a delta opioid receptor associated with an eating or energy contain the variant nucleic acids. The variants are named OPRDI-1 to contain the variant nucleic acids. The variants are named OPRDI-1 to contain the variant nucleic acids. The variants are named OPRDI-1 to contain the variant opioid receptor gene is located on chromosome 1. The nucleic acid molecules and delta opioid receptor variant are useful for disorder, such as anorexia nervosa. The allele specific primer is useful contained with the disorder cited. The present sequence is a genotyping PCR probe for detecting the presence of a particular SNP (single nucleotide polymorphism) in a sample

The methods are also useful for improving genetic diagnostic and screening methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful in forensic analysis of degraded, old, ancient and difficult to amplify and identify. This sequence represents a PCR primer used in the selection and amplification of genetic markers
                                                                                                         The invention relates to a novel isolated nucleic acid molecule comprising a variant gene associated with an eating disorder and selected from any of 119 polymorphisms with their corresponding genotyping in dataset, alleles and HGBASE identification, given in the specification. The novel nucleic acid molecule has polymorphisms in the serotonin receptor 1D, delta-opioid receptor, or dopamine receptor D2, which is useful in diagnostic and prognostic assays for eating disorders, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bergen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-JUL-2001; 2001US-0305153P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                          CC comprising oligonuclectides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC pulmonary obstruction and/or lung
CC pulmonary obstruction and/or lung
CC pulmonary obstruction and content and cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

can be anti-sense

to the

corresponding mRNA.

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targe nucleic acids associated with lung airway or lung dysfunction,

targeted to

and

```
The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, antiagesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition control of the reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or bronchoconstriction and/or lung construction, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction.

CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system ce., in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system ce., in the target and the text the sum environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ្សិស្តិសិស្តិសិស្តិសិស្តិសិស្តិសិស្តិសិស្តិសិស្តិសិស្តិសិស្តិ
